# Contemporary treatments for irregular heartbeat

## ATRIAL FIBRILLATION INCREASES YOUR RISK OF STROKE BY NEARLY 5 TIMES

Do you often feel your heart racing or flip-flopping in your chest? That abnormal heart beat could be the wake-up call for a serious heart rhythm problem called atrial fibrillation (A-Fib). If your heart isn't beating properly, blood clots can form, travel to the brain and cause a stroke. That's why people with A-Fib are five times more likely to suffer a stroke. Luckily, advances in treating A-Fib can significantly reduce this risk.

Come hear a board-certified electrophysiologist — a cardiologist who specializes in abnormal heart rhythms — describe the latest advances in diagnosing and treating A-fib, including new electrophysiology options.

**Speaker** Sameer Oza, MD, of Rocky Mountain Cardiology

**When** Thursday, July 12, from 11 a.m. to noon

**Where** Calvary Bible Church  
3245 Kalmia Avenue in Boulder

**RSVP** **Reservations required**  
Call 303-441-0580 or visit
