Advances in detecting and treating osteoporosis

Osteoporosis—a bone-weakening disease—is a major health threat for millions of Americans. In fact, half of all women and a quarter of men over age 50 will suffer a bone fracture because of osteoporosis. These fractures can be devastating and lead to chronic pain, loss of independence and, in some cases, death. Fortunately, early signs of osteoporosis can be detected quickly and painlessly and effective treatments are available.

Come hear two of our medical experts describe the latest methods for diagnosing osteoporosis and new medications for treating bone loss.

When Wednesday, June 1, from 7 to 8 p.m.

Speakers Kelly Mandagere, MD, with Boulder Endocrinology and
Jie Mao, MD, with Boulder Radiologists

Where Congregation Har HaShem, 3950 Baseline Rd., Boulder
